

## Assignment -2

### Data Visualization and Pre-processing

Assignment Date	24 September 2022
Student Name	DHIVYAPRIYA R
Student Roll Number	311519104014
Maximum Marks	2 Marks

**To Perform Below Tasks to complete the assignment:-**

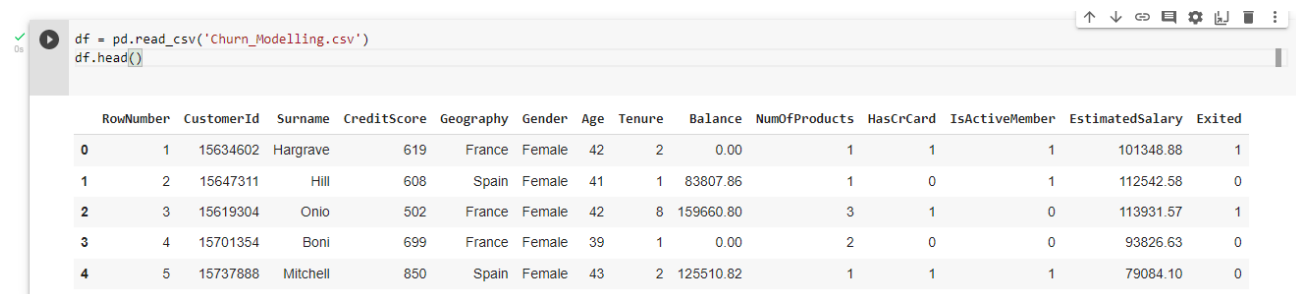

Step 1. Download the dataset: [Dataset](#)

Step 2. Load the dataset.

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
```

```
df = pd.read_csv('Churn_Modelling.csv')
df.head()
```

Output :

The screenshot shows a Jupyter Notebook interface. The code cell contains the following code:

```
df = pd.read_csv('Churn_Modelling.csv')
df.head()
```

The output cell displays the first five rows of the 'Churn\_Modelling.csv' dataset. The columns are: RowNumber, CustomerId, Surname, CreditScore, Geography, Gender, Age, Tenure, Balance, NumOfProducts, HasCrCard, IsActiveMember, EstimatedSalary, and Exited.

	RowNumber	CustomerId	Surname	CreditScore	Geography	Gender	Age	Tenure	Balance	NumOfProducts	HasCrCard	IsActiveMember	EstimatedSalary	Exited
0	1	15634602	Hargrave	619	France	Female	42	2	0.00	1	1	1	101348.88	1
1	2	15647311	Hill	608	Spain	Female	41	1	83807.86	1	0	1	112542.58	0
2	3	15619304	Onio	502	France	Female	42	8	159660.80	3	1	0	113931.57	1
3	4	15701354	Boni	699	France	Female	39	1	0.00	2	0	0	93826.63	0
4	5	15737888	Mitchell	850	Spain	Female	43	2	125510.82	1	1	1	79084.10	0

Step 3. Perform Below Visualizations.

- Univariate Analysis

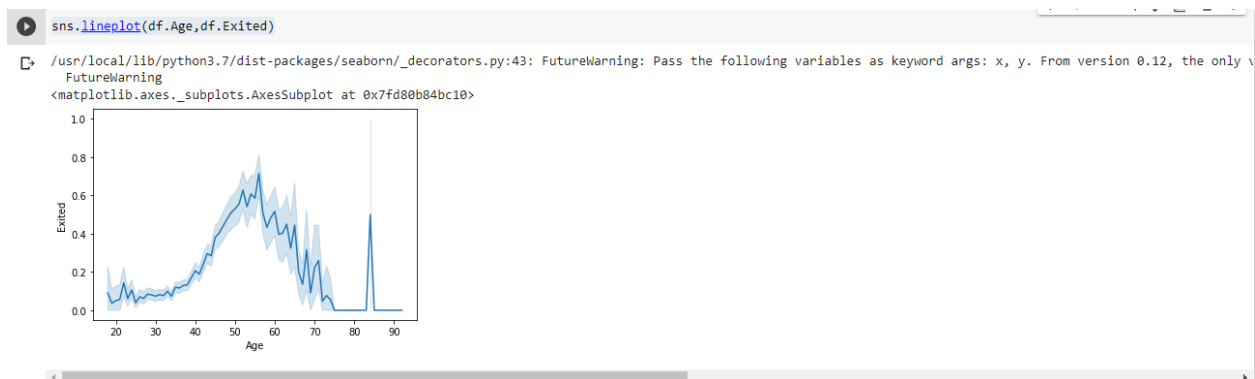

```
sns.distplot(df.Age)
```

Output :

```
sns.lineplot(df.Age,df.Exited)
```

Output :

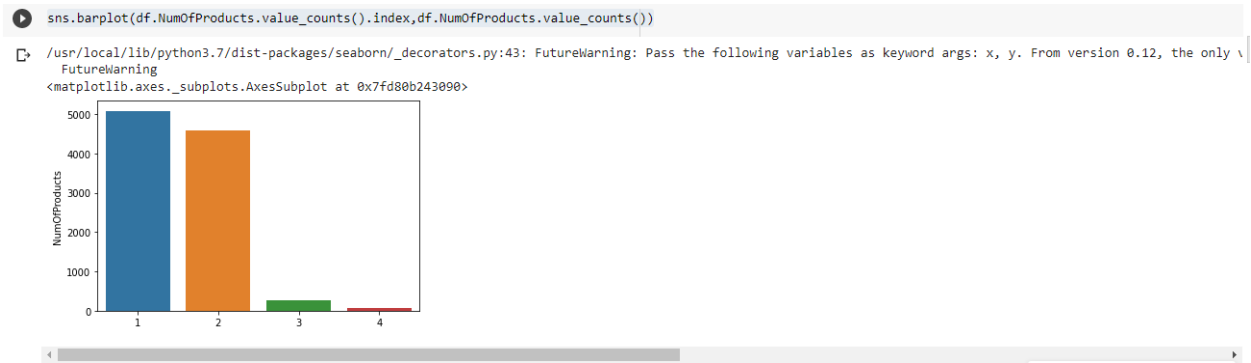

```
plt.pie(df.Gender.value_counts(),[0.2,0],colors=['red','green'],labels=['Male','Female'],autopct='%1.1f%%')  
plt.title('GENDER')  
plt.show()
```

Output :

```
sns.barplot(df.NumOfProducts.value_counts().index,df.NumOfProducts.value_counts())
```

Output :

## ● Bi - Variate Analysis

```
def countplot_2(x,hue,title=None,figsize=(6,5)):\n    plt.figure(figsize=figsize)\n    sns.countplot(data=df[[x,hue]],x=x,hue=hue)\n    plt.title(title)\n    plt.show()
```

countplot\_2('IsActiveMember','NumOfProducts','Credit Card Holders Product Details')

Output :

## ● Multi - Variate Analysis

```
sns.pairplot(df)
```

Output :

```
df.corr()
```

Output :

	RowNumber	CustomerId	CreditScore	Age	Tenure	Balance	NumOfProducts	HasCrCard	IsActiveMember	EstimatedSalary	Exited
RowNumber	1.000000	0.004202	0.005840	0.000783	-0.006495	-0.009067	0.007246	0.000599	0.012044	-0.005988	-0.016571

Exited	-0.016571	-0.006248	-0.027094	0.285323	-0.014001	0.118533	-0.047820	-0.007138	-0.156128	0.012097	1.000000

```
sns.heatmap(df.corr())
```

Output :

```
plt.figure(figsize=(16,15))
sns.heatmap(df.corr(),annot=True)
plt.show()
```

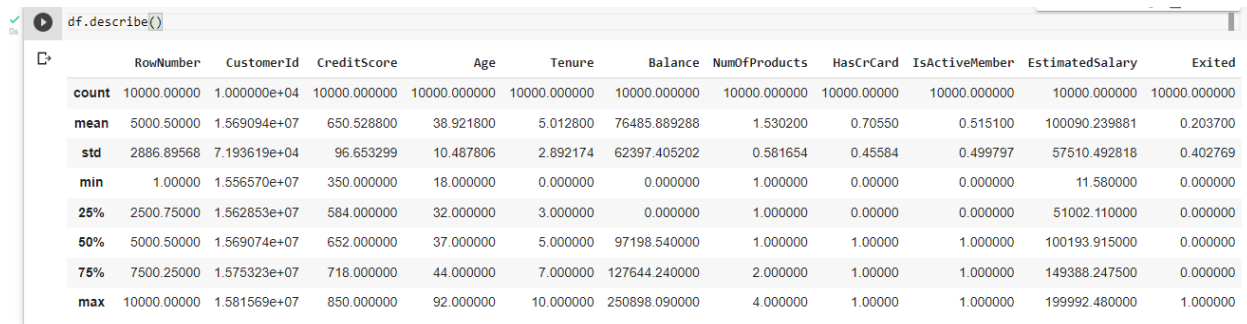

Output :

Step 4. Perform descriptive statistics on the dataset.

```
df.describe()
```

Output :

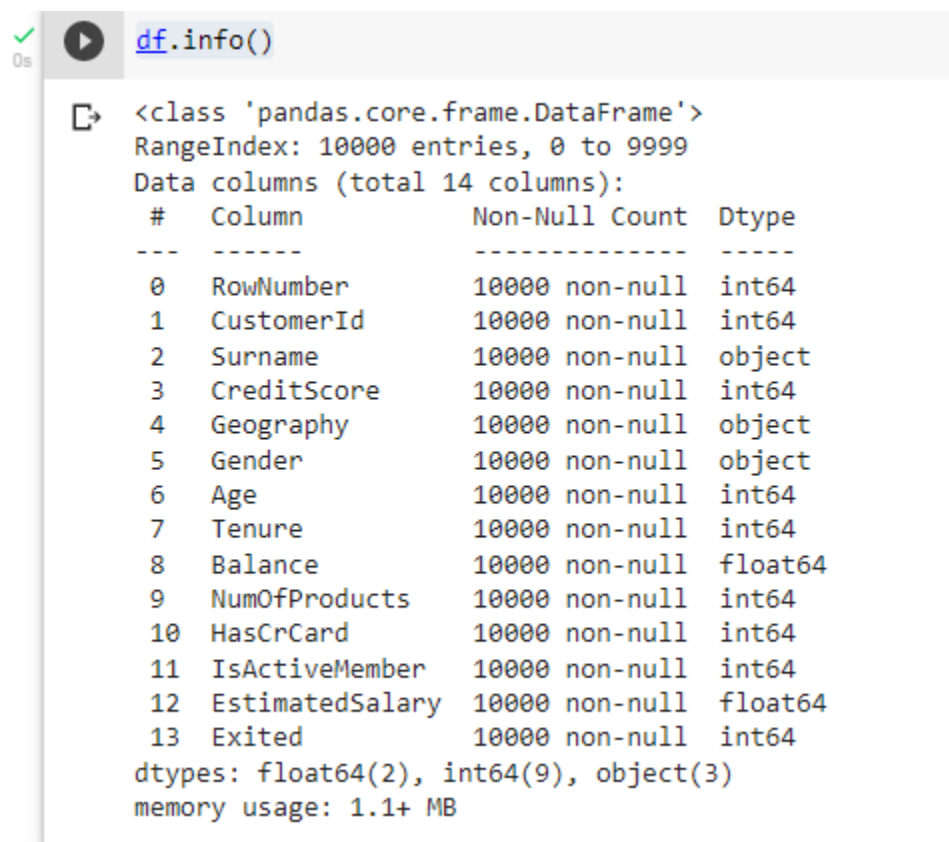

A screenshot of a Jupyter Notebook cell showing the output of the `df.describe()` function. The output is a summary table of the DataFrame's statistics.

	RowNumber	CustomerId	CreditScore	Age	Tenure	Balance	NumOfProducts	HasCrCard	IsActiveMember	EstimatedSalary	Exited
count	10000.00000	1.000000e+04	10000.000000	10000.000000	10000.000000	10000.000000	10000.000000	10000.000000	10000.000000	10000.000000	10000.000000

`df.info()`

Output :

A screenshot of a Jupyter Notebook cell showing the output of the `df.info()` function. The output provides detailed information about the DataFrame, including the number of entries, column names, data types, and memory usage.

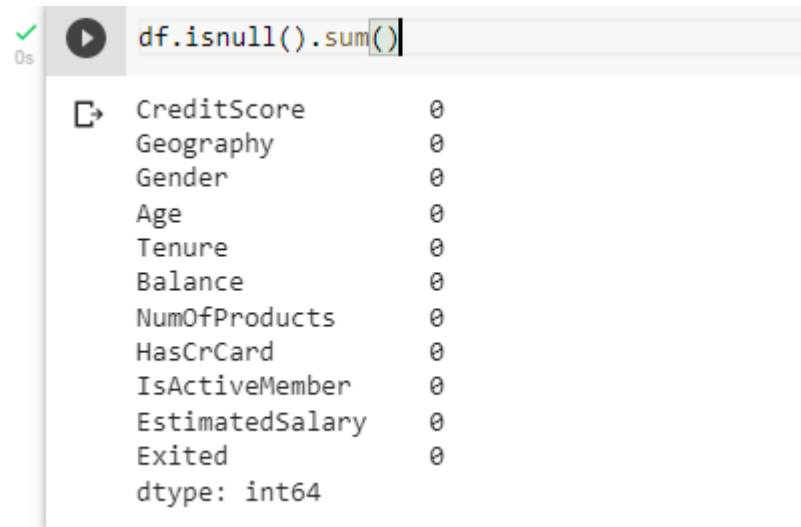

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10000 entries, 0 to 9999
Data columns (total 14 columns):
 #   Column                Non-Null Count  Dtype  
---  -
 0   RowNumber             10000 non-null  int64  
 1   CustomerId            10000 non-null  int64  
 2   Surname               10000 non-null  object  
 3   CreditScore           10000 non-null  int64  
 4   Geography             10000 non-null  object  
 5   Gender               10000 non-null  object  
 6   Age                  10000 non-null  int64  
 7   Tenure               10000 non-null  int64  
 8   Balance              10000 non-null  float64 
 9   NumOfProducts        10000 non-null  int64  
10   HasCrCard            10000 non-null  int64  
11   IsActiveMember       10000 non-null  int64  
12   EstimatedSalary      10000 non-null  float64 
13   Exited               10000 non-null  int64  
dtypes: float64(2), int64(9), object(3)
memory usage: 1.1+ MB
```

Step 5. Handle the Missing values.

```
df = df.drop(columns=['RowNumber','CustomerId','Surname'])
```

```
df.isnull().sum()
```

Output :

A screenshot of a Jupyter Notebook cell showing the execution of the code `df.isnull().sum()`. The cell has a green checkmark and a play button icon. The output is a table with two columns: the feature name and the count of null values. All counts are 0. The data type is `dtype: int64`.

CreditScore	0
Geography	0
Gender	0
Age	0
Tenure	0
Balance	0
NumOfProducts	0
HasCrCard	0
IsActiveMember	0
EstimatedSalary	0
Exited	0
dtype: int64	

```
df.shape
```

Output :

A screenshot of a Jupyter Notebook cell showing the execution of the code `df.shape`. The cell has a green checkmark and a play button icon. The output is a tuple `(10000, 11)`.

```
(10000, 11)
```

Step 6. Find the outliers and replace the outliers

```
sns.boxplot(df.CreditScore)
```

Output :

```
Q1 = df.CreditScore.quantile(0.25)
```

```
Q3 = df.CreditScore.quantile(0.75)
```

```
IQR = Q3-Q1
```

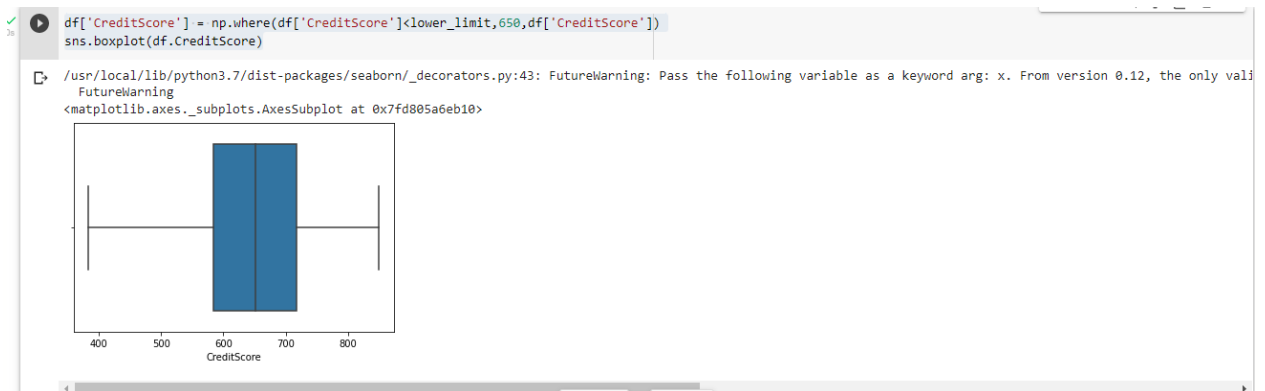

```
upper_limit = Q3 + (1.5*IQR)
```

```
lower_limit = Q1 - (1.5*IQR)
```

```
df['CreditScore'] = np.where(df['CreditScore']<lower_limit,650,df['CreditScore'])
```

```
sns.boxplot(df.CreditScore)
```

Output :

Step 7. Check for Categorical columns and perform encoding.

```
from sklearn.preprocessing import LabelEncoder
```

```
le = LabelEncoder()
```

```
df.Geography = le.fit_transform(df.Geography)
```

```
df.Gender = le.fit_transform(df.Gender)
```

```
df.head()
```

Output :

df.head()

	CreditScore	Geography	Gender	Age	Tenure	Balance	NumOfProducts	HasCrCard	IsActiveMember	EstimatedSalary	Exited
0	619	0	0	42	2	0.00	1	1	1	101348.88	1
1	608	2	0	41	1	83807.86	1	0	1	112542.58	0
2	502	0	0	42	8	159660.80	3	1	0	113931.57	1
3	699	0	0	39	1	0.00	2	0	0	93826.63	0
4	850	2	0	43	2	125510.82	1	1	1	79084.10	0

Step 8. Split the data into dependent and independent variables.

```
X = df.drop(columns=['Exited'])
X.head()
```

Output :

X = df.drop(columns=['Exited'])  
X.head()

	CreditScore	Geography	Gender	Age	Tenure	Balance	NumOfProducts	HasCrCard	IsActiveMember	EstimatedSalary
0	619	0	0	42	2	0.00	1	1	1	101348.88
1	608	2	0	41	1	83807.86	1	0	1	112542.58
2	502	0	0	42	8	159660.80	3	1	0	113931.57
3	699	0	0	39	1	0.00	2	0	0	93826.63
4	850	2	0	43	2	125510.82	1	1	1	79084.10

```
Y = df.Exited
Y.head()
```

Output :

Y = df.Exited  
Y.head()

0	1
1	0
2	1
3	0
4	0

Name: Exited, dtype: int64

Step 9. Scale the independent variables

```
from sklearn.preprocessing import MinMaxScaler
scale = MinMaxScaler()
X_scaled = pd.DataFrame(scale.fit_transform(X),columns=X.columns)
```

Step 10. Split the data into training and testing

```
from sklearn.model_selection import train_test_split
x_train , y_train , x_test , y_test = train_test_split(X_scaled,Y,test_size=0.2,random_state=0)
```

Output :

✓  
0s

`X_scaled.shape`

`(10000, 10)`

✓  
0s

[40] `x_train.shape`

`(8000, 10)`
